MOLEF J.M., BRUEMMENDORF T., RATHJEN F.G.;

BIOCHEM. BIOPHYS. RES. COMMUN. 161:931-938(1989).

1. FUNCTION: MEDIATES CELL SURFACE INTERACTIONS DURING NERVOUS SYSTEM DEVELOPMENT.

2. STREELOUAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR.

2. SIMILARITY: BELONGS TO THE IMMUNOCLOBULIN SUPERFAMILY. CONTAINS SIX C2-LIKE DOMAINS FOLLOWED BY FOUR FIBRONECTIN TYPE III-LIKE DOMAINS.

3. SIX C2-LIKE DOMAINS FOLLOWED BY FOUR FIBRONECTIN TYPE III-LIKE DOMAINS.

3. CAUTION: REF 2 SEQUENCE DIFFERS FROM THAT SHOWN IN THE C-TERMINUS MD IS LONGER DUE TO A FRAMESHIFT.

Mean 14.488; Variance 42.223; scale 0.343 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

gp100 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-1ymphocytes, and is a derivative of the melanoma-specific antigen cDNA25 (see R84854). gp100 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative
                                                                                                                                                                                                                                                                                                                                                                   DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Claim 81; Fig 5A: 184pp; English.

Tolymphocytes, and is a derivative of the melanocyte-melanoma-specific antigen gp100 (see R84855). Antigen cDNA25 is a source of immunogenic peptides (see R84199) which are optionally modified (see R84200-R8411) to enhance their binding to a MHC molecule and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunogenic peptides may be used in the detection and isolative of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Claim 1. Page 22-24, 40pp; English.
Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when sequence 661 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma associated antigen gp100 - used in vaccines and for the

NAME OF THE PART O

```
Novel DNA encoding triol poly-ketide synthase - used to isolate and identify homologues of triol poly-ketide synthase, and in the treatment of thyer-cholesterolaemia and in the treatment of thyer-cholesterolaemia.

Tof hyper-cholesterolaemia and in the treatment of Staure 2: 107pp; English.

The full-length TPKS-encoding DNA in plasmid pLOA was designated pryks100. Splicing of the introns from the DNA equence and translation of the 9114 nt ORF results in a protein of 3038 AAs (R74171) with a mol. wt. of 269,000 daltons. Inspection of the TPKS AA sequence for active price and motifs known to be associated with collyketide synthases and fatty acid synthase (RAS) activities resulted in the identification of candidates for expected sites also the second fatty acid synthase (RAS) activities of the second fatty acid synthase (See FT). Except for the presence of a methyl transferase, not present in FAS, the same as that observed for the rat FAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine against hepatitis A virus infection - comprises novel

                        ð
attenuated hepatitis A virus strain.

Claim 1; Fig 1; 18pp; English.

The attenuated HAV is useful for inducing protective immunity against

HAV. This strain (Pass 35) differs from the wild type HAV HM-175 by

several nucleotide changes distributed throughout the genome, is

attenuated for chimpanzees, elicits serum neutralising antibodies, and is

suitable for use as an HAV vaccine. It is noted that not all the changes

are necessary for attenuation and use as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

N6080 and oligonucleotide fragments are useful in detection of hepatitis A virus; transformed hosts may be used for expression of polypeptides and fragments useful in vaccines which are capable of inducing immunocompetent B cells for particles which are capable of inducing immunocompetent B cells for passive immunotherapy. Host cell expressing surface layer protein fusion protein - used for host presentation of antigens and vaccine prodn.
Disclosure; Fig.6, 95pp; English.
A probe based on the N-terminal sequence of B. sphaericus P-1 (LMG P-13855) surface layer protein was used to screen an HindIII-generated library to isolate the slp gene. Promoter regions of the gene are used in genetic constructs providing surface expression of heterologous proteins in P-1 hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chicken cytotactin.

Reposition of peptide reactive with Candida albicans induced antibodies

Protein or peptide reactive with Candida albicans induced antibodies

Tableans infections

Claim 7; Page 26; 37pp; English.

Peptides RB1710-25 are derived from the Candida albicans enolase protein

(RB1708). The peptides can be used to diagnose, in a serum sample,
antibodies induced by a Candida albicans infection and hence the
infection itself. The gene encoding the enolase was isolated from a

C.albicans Canna Sample of Vaginoses. The resultant clone

contained a 470 bp open reading frame encoding residues 93-249 (RB1709).

This clone was used to screen a genomic library and obtain the full
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10-MAY-1996 (first entry)
Recombinant C.albicans enolase residues 93-249.

The present sequence is that of a carbonyl reductase (ALD) isolated from Sporobolomyces salmonicolor IF01038. The enzyme is used in the synthesis of an (R)-gamma-substituted-beta-hydroxybutyrate (GSBH) from a gamma-substituted acetoacetate. The GSBH is useful as a raw material for the synthesis of drugs and agricultural chemicals.

Claim 9; Page 118-126; 159pp; English.
Chicken cytotactin (R94562) and human cytotactin (R94562) are multidomain extracellular matrix proteins capable of simulating neuronal cell attachment, neurite outgrowth and cell elongation. The cytotactins, or functional portions of them (see R94564-69), can be obtd. by expression of encoding DNA (see T14548 and (T14547) in host cells, e.g. as GST fusion proteins in Escherichia coll. They have therapeutic and diagnostic applins. and can be used to raise antibodies.

albicans infections
Claim 4; Page 23-24; 37pp; English.
The amino acid sequence of the Candida albicans enolase which has a mol.
The amino acid sequence of the Candida albicans enolase which has a mol.
The amino acid sequence of the Candida albicans constants.

Expression library in lambda-gtil using human sera from a patient with a clinical history of vaginoses. The resultant clone contained a 470 bp open reading frame encoding residues 93-249 (R81709). This clone was used to screen a genomic library and obtain the full length clone. The protein sequence was used to generate the peptides R81710-25 which can be used to diagnose, in a serum sample, antibodies induced by a candida albicans infection and hence the infection itself.
                                                                                                                                                                   albicans infections
Claim 6; Page 23-24; 37pp; English.
The amino acid sequence of residues 93-249 of the 48 kD Candida albicans
enolase. This DNA encoding this fragment of the full length enolase was
isolated from a C.albicans of DNA expression library in lambda-gtl1 using
human sera from a patient with a clinic history of vagenoses. The
resultant clone contained a 470 bp open reading frame encoding residues
93-249. This clone was used to screen a genomic library and obtain the
full length clone. The protein sequence was used to generate the
peptides R81710-25 which can be used to diagnose, in a serum sample,
antibodies induced by a candida albicans infection and hence the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant C.albicans eñolase.
Candida albicans; enolase; lambda-gtl1; serum; antibody; candidiasis;

NT The sequence is related to the amino end of the myc protein. It is
missing the region thought to be important for nuclear
localization, DNA binding, transforming activity, and
oligomerization.

-I. PITH. SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS.
-I. SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS,
EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2,
VP3, AND VP4.
-I. SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
